Climate change adaptation
From Wikipedia, the free encyclopedia
Use dmy dates
This article needs to be updated. Please update this article to reflect recent events or newly available information. (August 2016)
Climate change adaptation (CCA) is a response to global warming (also known as "climate change").[1]
SDG13 targets to strengthen countries resilience and adaptive capacities to climate related issues.[2] The Intergovernmental Panel on Climate Change (IPCC) defines adaptation as: 'the process of adjustment to actual or expected climate and its effects. In human systems, adaptation seeks to moderate or avoid harm or exploit beneficial opportunities. In some natural systems, human intervention may facilitate adjustment to expected climate and its effects'.[3] This adjustment includes many areas such as infrastructure,[4] agriculture[5] and education.
Even if emissions are stabilized relatively soon, global warming and its effects will last many years due to the delay times caused by past global warming, and adaptation would be necessary to the resulting changes in climate.[6] If all greenhouse gas emissions were to stop today, the Earth's average surface temperature would climb another 0.6 degrees over the next decades before temperatures stopped rising.[7]
Adaptation actions can be considered as either incremental adaptation (actions where the central aim is to maintain the

:Agreed. Climate is a very complex phenomenon, and the effects of overall global warming may be so diverse that only "climate change" may encompass them. [[User:Kortoso|Kortoso]] ([[User talk:Kortoso|talk]]) 17:45, 29 September 2014 (UTC)
